

GROUND LINK® AID+

Get Your Crew Connected

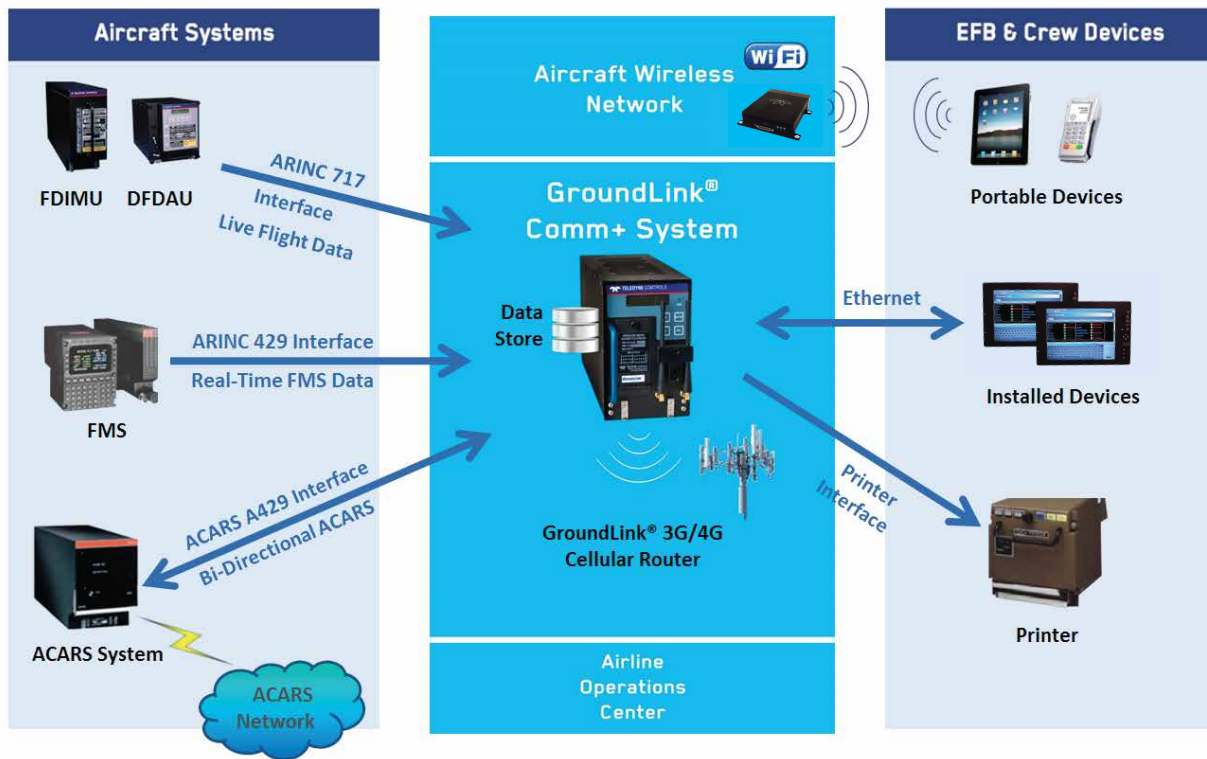

Extending Connectivity to Wired/Wireless Flight & Cabin Crew Devices

Teledyne Controls provides a complete solution for enhancing EFB systems functionality by adding off-board communication, access to aircraft parameters and data management capability via its new GroundLink® AID+ system. This solution extends all AID functions to WiFi enabled EFB systems and other crew devices through a cockpit wireless network available in all flight phases. The AID+ system permits wireless tablet based EFBs (such as iPads) or traditional Ethernet connected Class1/2 EFBs to be integrated with the aircraft regardless of EFB form factor, operating systems or whether they connect with the aircraft as a wired or wireless EFB system.

An easy add-on to the GroundLink® Comm+ system, the GroundLink® AID+ system extends the airline's investment already made in the GroundLink® Comm+ provisions and hardware for applications, such as automated wireless Flight Data download and/or automated software and data upload to the aircraft mass storage data loader.

Key functions to support EFB services:

- Aircraft Parameter Service - access to aircraft parameters, both A429 and A717
- On-Aircraft DataStore - shared persistent data storage for EFB applications
- Wireless Router for Off-Aircraft Communication via 3G/4G Cellular
- ACARS Proxy Service to interface the EFB with aircraft ACARS system
- Flight Deck Printing from EFB applications

Wired option enabled by Software Upgrade Only

Enabling the GroundLink® AID+ functions is very easy. The AID+ function only requires a software upgrade and some additional wiring.

WiFi option with the WAP

The WiFi option extends all the AID+ functionality to WiFi enabled portable devices. Enabling the WiFi option simply requires the provision of a wireless network through the installation of a Wireless Access Point (WAP) in or near the cockpit.

Benefits of GroundLink® AID+ and WAP

- Connects tablets and crew devices that can only access the Internet and server networks via WiFi
- Enables them to be fully utilized to solve flight deck and cabin crew information challenges
- Provides a Local Area Network on aircraft
- Coordinates information across tablets
- Provides on-aircraft data storage
- Provides access to aircraft parameters
- Eliminates manual data entry errors
- Provides access to cockpit printer and ACARS messaging
- Provides Internet access while on the ground
